BTT SEED BOOT SYSTEM

The BTT 6" seed boot is part of a quick change system with seven different interchangeable seed boot attachments to choose from. Each attachment gives a different seed spread pattern and allows you to match your seed spread to the width of the opener you are using.

The quick change system is perfect for producers who want to switch back and forth from a wide seed spread behind a sweep to a narrow seed band behind a knife.

The seed boot system consists of two parts:

- 1 The seed boot holder which bolts on to the back of the shank.
- 2 The seed boot attachment which fits into the holder and is secured with a nut and bolt.

6" SEED BOOT

The 6" Seed Boot (300-ATM-1006) is an attachment that works with the seed boot system and is ideal for organic operations because of the wide seed spread.

It is designed to distribute the seed in a pattern up to 6" (152 mm) wide when used behind a wider sweep. Seed spread may vary depending on sweep size, soil type and fan speed.

The seed boot is made from high chrome cast iron and is designed to last. Like all of our products, it is backed by our Performance Guarantee.

MINIMIZE WEEDS. MAXIMIZE YIELDS.

No matter what type of operation you run, conventional or organic, minimizing weed growth to maximize yields is always a top priority.

Using the 6" seed boot along with a wider sweep provides a great mechanical method of removing weeds during seeding, creating a more competitive crop, and benefiting any type of producer.

UNDERSTANDING THE NEEDS OF ORGANIC FARMERS

As a proud member of the agriculture community, BTT has always kept a close eye on the changing philosophies and farm practices affecting the industry. One of the most impactful changes in recent years has been the growth of Certified Organic Farming.

We understand and respect that every organic operation has two major goals in mind:

1. Grow the healthiest, most nutritious foods possible.

This means prohibiting any chemicals or genetically modified organisms that can be deemed harmful to humans and/or the environment.

2. Minimize weeds to maximize crop yields.

Due to the fact that chemicals cannot be used to contain weeds, other sustainable methods need to be employed. Weeds can be minimized through mechanical control and by increasing in-crop weed competition.

In light of these important goals, the strategies, methods and equipment requirements of a Certified Organic Farmer are slightly different than those of the Conventional Farmer. BTT understands these challenges and will continue to work with producers to develop sustainable solutions that help them attain these goals.

RESEARCH & DEVELOPMENT

For years, the BTT R&D team has been working with producers to develop and refine our line of seeding and tillage tools. A request we often hear is to develop a product that will more effectively minimize weed growth and maximize seed bed utilization. This request is what led us to the development of the 6" Seed Boot.

The photo on the right shows actual results we've been able to achieve with this product. BTT operates research farms that are used to develop products for both Certified Organic and Conventional Producers.
